

AI Design Companion

CAREEM PRODUCT DESIGNER CHALLENGE

A human-in-the-loop concept for translating fragmented product observations into testable UX directions.

PROTOTYPE DOCUMENT	README.md and app.py
WORKING APPLICATION	https://flowmate-careem.streamlit.app/
DATASET	200-record dummy dataset created with ChatGPT. Users select a feature, customer context, and scenario note in the UI; the dataset can be downloaded as CSV.

Problem Designers often have fragmented research notes and need to quickly turn them into concrete UX directions.

Solution An AI companion that transforms product observations into user problems, flows, layout alternatives, UI copy, and usability risks.

How AI is used LLM -> structured UX analysis -> multiple design directions -> human selection/refinement.

Prototype scenario A Careem-like food delivery tracking scenario using dummy information. The prototype demonstrates how rough user feedback can become three alternative experience directions while surfacing trade-offs and usability risks.

100-word summary

FlowMate helps product designers turn rough notes into actionable UX concepts. Its synthetic dataset has 200 scenarios across Careem features, contexts, and usability frictions. Users choose a feature, context, and note from dropdowns; the prototype identifies needs and goals, suggests a flow, brainstorms three layout directions, drafts interface copy, and surfaces usability risks with mitigations. Groq's GPT-OSS model generates live results. The human-in-the-loop approach presents alternatives and trade-offs for critique, not a single prescribed answer. All scenarios are fictional; validate outputs with research and product constraints. The complete synthetic dataset is generated in-app and downloadable as a CSV for review.
