

FlowMate

AI Design Companion · Careem Product Designer Challenge

Problem

Designers often have fragmented research notes and need to quickly turn them into concrete UX directions.

Solution

An AI companion that transforms product observations into user problems, flows, layout alternatives, UI copy and usability risks.

How AI is used

LLM → structured UX analysis → multiple design directions → human selection/refinement.

Prototype scenario

A Careem-like food delivery tracking scenario using dummy information. The prototype demonstrates how rough user feedback can become three alternative experience directions while surfacing trade-offs and usability risks.

Human-in-the-loop

AI generates possibilities; the designer evaluates them against user needs, business constraints, accessibility and product context. The tool deliberately avoids presenting one “correct” design.
